Abstract Algebra I
The Isomorphism Theorems

The Fundamental Homomorphism Theorem (FHT) is the first of four basic theorems about homomorphism and their structure.

These are commonly called “The Isomorphism Theorems”:

- First Isomorphism Theorem: “Fundamental Homomorphism Theorem”
- Second Isomorphism Theorem: “Diamond Isomorphism Theorem”
- Third Isomorphism Theorem: “Freshman Theorem”
- Fourth Isomorphism Theorem: “Correspondence Theorem”

All of these theorems have analogues in other algebraic structures: rings, vector spaces, modules, and Lie algebras, to name a few.

In this lecture, we will summarize the last three isomorphism theorems and provide visual pictures for each.

We will prove one, outline the proof of another (homework!), and encourage you to try the (very straightforward) proofs of the multiple parts of the last one.

Finally, we will introduce the concepts of a commutator and commutator subgroup, whose quotient yields the abelianization of a group.
The Second Isomorphism Theorem

Let $H < G$, and $N < G$. Then

(i) The product $HN = \{hn \mid h \in H, \ n \in N \}$ is a subgroup of $G$.

(ii) The intersection $H \cap N$ is a normal subgroup of $H$.

(iii) The following quotient groups are isomorphic:

$$HN/N \cong H/(H \cap N)$$

Proof (sketch)

Define the following map

$$\phi : H \rightarrow HN/N, \quad \phi : h \mapsto hN.$$ 

If we can show:

1. $\phi$ is a homomorphism,
2. $\phi$ is surjective (onto),
3. $\text{Ker } \phi = H \cap N$,

then the result will follow immediately from the FHT. Watch M. Macauley’s video of Slides 4.5 and Judson’s textbook Theorem 11.12 for more details. The rest is left as exercise.
The Third Isomorphism Theorem

Freshman theorem

Consider a chain $N \leq H \leq G$ of normal subgroups of $G$. That is, both $N$ and $H$ are normal subgroups of $G$, and $N < H$. Then

1. The quotient $H/N$ is a normal subgroup of $G/N$;
2. The following quotients are isomorphic:

\[(G/N)/(H/N) \cong G/H.\]

(Concept and graphics by Zach Teitler of Boise State)
The Third Isomorphism Theorem

Freshman theorem

Consider a chain $N \leq H \leq G$ of normal subgroups of $G$. Then (i) $H/N \trianglelefteq G/N$ and (ii) $(G/N)/(H/N) \cong G/H$.

Proof

(i) The fact that $H/N \trianglelefteq G/N$ is shown in M. Macauley’s video. To show (ii), define the map

$$\varphi: G/N \rightarrow G/H, \quad \varphi: gN \mapsto gH.$$ 

- **Show $\varphi$ is well-defined**: Suppose $g_1N = g_2N$. Then $g_1 = g_2n$ for some $n \in N$. But $n \in H$ because $N \leq H$. Thus, $g_1H = g_2H$, i.e., $\varphi(g_1N) = \varphi(g_2N)$.

- **Show that $\varphi$ is onto and a homomorphism**.

- **Apply the FHT**:

$$\text{Ker } \varphi = \{gN \in G/N \mid \varphi(gN) = H\} = \{gN \in G/N \mid gH = H\} = \{gN \in G/N \mid g \in H\} = H/N.$$ 

By the FHT, $(G/N)/\text{Ker } \varphi = (G/N)/(H/N) \cong \text{Im } \varphi = G/H.$
The Fourth Isomorphism Theorem

Correspondence theorem (idea)

Let \( N \triangleleft G \). There is a 1–1 correspondence between subgroups of \( G/N \) and subgroups of \( G \) that contain \( N \). In particular, every subgroup of \( G/N \) can be written as \( \overline{A} := A/N \) for some \( A \) satisfying \( N < A < G \).

This means that the corresponding subgroup lattices are identical in structure.

Example

Here \( G = Q_8 \) and \( N = \{1, -1\} \).

The quotient \( Q_8/\langle -1 \rangle \) is isomorphic to \( V_4 \). The subgroup lattices can be visualized by “collapsing” \( \langle -1 \rangle \) to the identity.
Correspondence theorem (formally)

Let $N \triangleleft G$. Then there is a bijection from the subgroups of $G/N$ and subgroups of $G$ that contain $N$. In particular, every subgroup of $G/N$ has the form $\overline{A} := A/N$ for some $A$ satisfying $N < A < G$. Moreover, if $A, B < G$, then

1. $A \leq B$ if and only if $\overline{A} \leq \overline{B}$,
2. If $A \leq B$, then $[B : A] = [\overline{B} : \overline{A}]$,
3. $\langle A, B \rangle = \langle \overline{A}, \overline{B} \rangle$,
4. $\overline{A \cap B} = \overline{A} \cap \overline{B}$,
5. $A \triangleleft G$ if and only if $\overline{A} \triangleleft \overline{G}$.

Example with $G = D_4$ and $N = \langle r^2 \rangle$
Application: commutator subgroups and abelianizations

Idea: We’ve seen how to divide \( \mathbb{Z} \) by \( 12\mathbb{Z} \), thereby “forcing” all multiples of 12 to be zero. This is one way to construct the integers modulo 12: \( \mathbb{Z}_{12} \cong \mathbb{Z}/12\mathbb{Z} \).

Now, let \( G \) be nonabelian. We want to divide \( G \) by its “non-abelian parts,” making them zero and leaving only “abelian parts” in the resulting quotient.

**Definition**

A **commutator** of a group \( G \) is an element of the form \( aba^{-1}b^{-1} \), where \( a, b \in G \).

If \( G \) is nonabelian, there are non-identity commutators: \( aba^{-1}b^{-1} \neq e \) in \( G \).

\[
\begin{align*}
ab & = ba \\
ab & \neq ba
\end{align*}
\]

In this case, the set \( C := \{ aba^{-1}b^{-1} \mid a, b \in G \} \) contains more than the identity.

**Definition**

Define the **commutator subgroup** \( G' \) of \( G \) to be \( G' := \langle aba^{-1}b^{-1} \mid a, b \in G \rangle \).

This is a normal subgroup of \( G \) (exercise). If we quotient out by it, we get an abelian group! (Because we have killed every instance of the “\( ab \neq ba \) pattern”)
Commutator subgroups and abelianizations

**Definition**

The **abelianization** of $G$ is the quotient group $G/G'$. This is the group that one gets by “killing off” all nonabelian parts of $G$.

In some sense, the commutator subgroup $G'$ is the **smallest normal subgroup** $N$ of $G$ such that $G/N$ is abelian. [Note that $G$ would be the “largest” such subgroup.]

Equivalently, the quotient $G/G'$ is the **largest abelian quotient** of $G$. [Note that $G/G \cong \{e\}$ would be the “smallest” such quotient.]

**Universal property of commutator subgroups**

Suppose $f: G \to A$ is a homomorphism to an abelian group $A$. Then there is a unique homomorphism $h: G/G' \to A$ such that $f = hq$:

![Diagram](https://via.placeholder.com/150)

We say that $f$ “factors through” the abelianization, $G/G'$. 
Commutator subgroups and abelianizations

Examples

Check that the commutator subgroups of $A_4$ and $D_4$ are

$$A_4' = \langle xyx^{-1}y^{-1} \mid x, y \in A_4 \rangle \cong V_4,$$
$$D_4' = \langle xyx^{-1}y^{-1} \mid x, y \in D_4 \rangle = \langle r^2 \rangle.$$

By the Correspondence Theorem, the abelianization of $A_4$ is $A_4/V_4 \cong C_3$, and the abelianization of $D_4$ is $D_4/\langle r^2 \rangle \cong V_4$.

Notice that $G/G'$ is abelian, and moreover, taking the quotient of $G$ by any subgroup drawn above $G'$ will yield an abelian group.
