

# Sec 7.3 Trig Substitution

$$\int \frac{x^2}{\sqrt{4-x^2}} dx$$

(A)

$$\int x^3 \sqrt{x^2+4} dx$$

(B)

$$\int \frac{dx}{[9x^2-25]^{\frac{3}{2}}}$$

(C)

$$\int \frac{dx}{[x^2+2x+2]^2}$$

"Complete the square"

(D)

# Webwork # 7

•  $\int_0^{\sqrt{2}} \frac{x^2}{\sqrt{4-x^2}} dx$  can be solved with Trig substitution

• Label  so that  $x$  and  $\sqrt{4-x^2}$  are side labels.

Either

or

will work

The derivative of  $\sin \theta$  is "nicer", so I choose

$$\int_0^{\sqrt{2}} \frac{x^2}{\sqrt{4-x^2}} dx$$

can be solved with Trig substitution

Let  $\frac{x}{2} = \sin \theta$ , where

$\theta$  is in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$

Domain restriction  
(Sec 6.6)

so that

$$\arcsin\left(\frac{x}{2}\right) = \theta$$

makes sense

①

$$x = 2 \sin \theta$$

$$dx = 2 \cos \theta d\theta$$

②

Write  $\frac{1}{\sqrt{4-x^2}}$  in terms of  $\theta$ :

$$\frac{2}{\sqrt{4-x^2}} = \frac{1}{\cos \theta}$$

$$\Rightarrow \frac{1}{\sqrt{4-x^2}} = \frac{1}{2} \frac{1}{\cos \theta}$$

③

Write  $x^2$  in terms of  $\theta$ :

$$x^2 = (2 \sin \theta)^2$$

④

Substitute endpoints so that  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$

$$x=0 \Rightarrow \frac{0}{2} = \sin \theta \Rightarrow \theta = 0$$

$$x=\sqrt{2} \Rightarrow \frac{\sqrt{2}}{2} = \sin \theta \Rightarrow \theta = \frac{\pi}{4}$$

$$\int_0^{\sqrt{2}} \frac{x^2}{\sqrt{4-x^2}} dx = \int_{\theta=0}^{\theta=\frac{\pi}{4}} 2^2 (\sin \theta)^2 \cdot \frac{1}{2} \frac{1}{\cos \theta} \cdot 2 \cos \theta d\theta$$

Let  $\frac{x}{2} = \sin \theta$ , where

$\theta$  is in  $[-\frac{\pi}{2}, \frac{\pi}{2}]$

①  $dx = 2 \cos \theta d\theta$

②  $\frac{1}{\sqrt{4-x^2}} = \frac{1}{2 \cos \theta}$

③  $x^2 = (2 \sin \theta)^2$

④  $x=0 \Rightarrow \theta=0$

$x=\sqrt{2} \Rightarrow \theta = \frac{\pi}{4}$

$$= \int_0^{\frac{\pi}{4}} 4 (\sin \theta)^2 d\theta$$

$$= \int_0^{\frac{\pi}{4}} 4 \cdot \frac{1}{2} [1 - \cos(2\theta)] d\theta$$

$$= \int_0^{\frac{\pi}{4}} [2 - 2 \cos(2\theta)] d\theta$$

$$= 2\theta - 2 \frac{\sin(2\theta)}{2} \Big|_{\theta=0}^{\theta=\frac{\pi}{4}}$$

$$= \left( 2 \frac{\pi}{4} - \sin\left(2 \frac{\pi}{4}\right) \right) - \left( 0 - \sin(0) \right)$$

$$= \frac{\pi}{2} - \sin\left(\frac{\pi}{2}\right)$$

$$= \frac{\pi}{2} - 1 \geq \frac{3}{2} - 1 > 0$$

sanity check:

$\frac{x^2}{\sqrt{4-x^2}}$  is positive (except at  $x=0$ )

so  $\int_0^{\sqrt{2}} \frac{x^2}{\sqrt{4-x^2}} dx$

should be positive

Summary  
so far

(A)  $\int \frac{x^2}{\sqrt{4-x^2}} dx$  can be solved with Trig substitution

or

(B)  $\int x^3 \sqrt{x^2+4} dx$  can also be solved with trig substitution.

Label  so that  $x$  and  $\sqrt{4+x^2}$  are side labels.

What should be the label for the hypotenuse?

(a)

(b)

(c)

(d)

# Webwork #3

$$\int_0^2 x^3 \sqrt{x^2 + 4} \, dx$$

Either

or

will work

but  $\frac{d}{d\theta} \tan(\theta) = \boxed{[\sec(\theta)]^2}$  is easier to work with than  $\frac{d}{d\theta} \cot(\theta) = \boxed{-[\csc(\theta)]^2}$

so I choose

$$\int_0^2 x^3 \sqrt{x^2+4} \, dx$$

Let  $\frac{x}{2} = \tan(\theta)$  where

$\theta$  is in  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

Domain restriction

(Sec 6.6)

so that

$$\arctan\left(\frac{x}{2}\right) = \theta$$

makes sense

①  $x = 2 \tan(\theta)$

$$dx = 2 (\sec(\theta))^2 d\theta$$

② Write  $\sqrt{x^2+4}$  in terms of  $\theta$ :

$$\frac{\sqrt{x^2+4}}{2} = \frac{1}{\cos(\theta)}$$

$$\sqrt{x^2+4} = \frac{2}{\cos(\theta)}$$

③ Write  $x^3$  in terms of  $\theta$ :

$$x^3 = 8 (\tan \theta)^3$$

④ Substitute endpoints so that  $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$

$$x=0 \Rightarrow \frac{0}{2} = \tan \theta \Rightarrow \theta = 0$$

$$x=2 \Rightarrow \frac{2}{2} = \tan \theta \Rightarrow \theta = \frac{\pi}{4}$$

$$\int_0^2 x^3 \sqrt{x^2+4} \, dx$$

Let  $\frac{x}{2} = \tan(\theta)$  where

$\theta$  is in  $(-\frac{\pi}{2}, \frac{\pi}{2})$

$$= \int_{\theta=0}^{\theta=\frac{\pi}{4}} 8(\tan\theta)^3 \frac{2}{\cos\theta} 2(\sec\theta)^2 \, d\theta$$

$$= 32 \int_0^{\frac{\pi}{4}} (\tan\theta)^3 (\sec\theta)^3 \, d\theta$$

Use technique from Lecture 7.2 notes

①  $dx = 2(\sec(\theta))^2 \, d\theta$

②  $\sqrt{x^2+4} = \frac{2}{\cos(\theta)}$

③  $x^3 = 8(\tan\theta)^3$

④  $x=0 \Rightarrow \theta=0$   
 $x=2 \Rightarrow \theta=\frac{\pi}{4}$

$$\int_0^2 x^3 \sqrt{x^2+4} \, dx$$

Let  $\frac{x}{2} = \tan(\theta)$  where

$\theta$  is in  $(-\frac{\pi}{2}, \frac{\pi}{2})$

$$\textcircled{1} \quad dx = 2 (\sec(\theta))^2 \, d\theta$$

$$\textcircled{2} \quad \sqrt{x^2+4} = \frac{2}{\cos(\theta)}$$

$$\textcircled{3} \quad x^3 = 8 (\tan\theta)^3$$

$$\textcircled{4} \quad \begin{aligned} x=0 &\Rightarrow \theta=0 \\ x=2 &\Rightarrow \theta=\frac{\pi}{4} \end{aligned}$$

$$= \int_{\theta=0}^{\theta=\frac{\pi}{4}} 8 (\tan\theta)^3 \frac{2}{\cos\theta} 2 (\sec\theta)^2 \, d\theta$$

$$= 32 \int_0^{\frac{\pi}{4}} (\tan\theta)^3 (\sec\theta)^3 \, d\theta$$

$$= 32 \int_0^{\frac{\pi}{4}} (\tan x)^2 (\sec x)^2 \underbrace{\sec(x) \tan(x)}_{\substack{\text{put one } \tan(x) \sec(x) \text{ aside} \\ \text{because } \frac{d}{dx} \sec(x) = \sec x \tan x}} \, dx$$

$$= 32 \int_0^{\frac{\pi}{4}} [(\sec x)^2 - 1] (\sec x)^2 \sec(x) \tan(x) \, dx$$

$$= 32 \int_{u=\sec 0}^{u=\sec \frac{\pi}{4}} [u^2 - 1] u^2 \, du$$

$$= 32 \int_{\frac{1}{\cos 0} = 1}^{\frac{1}{\cos \frac{\pi}{4}} = \frac{2}{\sqrt{2}} = \sqrt{2}} (u^4 - u^2) \, du$$

$$= 32 \left( \frac{u^5}{5} - \frac{u^3}{3} \Big|_{u=1}^{u=\sqrt{2}} \right)$$

$$= 32 \left( \frac{1}{5} 2^{\frac{5}{2}} - \frac{1}{5} - \frac{1}{3} 2^{\frac{3}{2}} + \frac{1}{3} \right)$$

Apply  
 $(\tan x)^2 = (\sec x)^2 - 1$

$u = \sec x$   
 $du = \sec x \tan x \, dx$

# Summary so far

$$(A) \int_0^{\sqrt{2}} \frac{x^2}{\sqrt{4-x^2}} dx$$

$$(B) \int_0^2 x^3 \sqrt{x^2+4} dx$$

$$(C) \int \frac{1}{[9x^2-25]^{\frac{3}{2}}} dx$$

(C)  $\int \frac{1}{[9x^2-25]^{\frac{3}{2}}} dx$

Label  so that  $x$  and  $\sqrt{9x^2-25}$  are side labels.  
What should be the label for the hypotenuse?

option (a):

option (b):

option (c):

option (d):

# Webwork # 5

$$\int \frac{1}{[9x^2 - 25]^{\frac{3}{2}}} dx$$

Either

or

will work

but  $\frac{d}{d\theta} \sec(\theta) = \sec(\theta) \tan(\theta)$  is easier to work with than  $\frac{d}{d\theta} \csc(\theta) = -\csc(\theta) \cot(\theta)$

so I choose

# secant (x)

•  $\sec(\theta) \stackrel{\text{def}}{=} \frac{1}{\cos \theta} = \frac{1}{\left(\frac{x}{r}\right)} = \frac{r}{x}$  if  $\cos(\theta) \neq 0$

• Domain of  $\sec(\theta)$  is all numbers  
for which  $\cos(\theta) \neq 0$ , i.e.  
all numbers except  $k \frac{\pi}{2}$  with odd integer  $k$

• Image (range) of  $\cos(\theta)$  is  $[-1, 1]$ ,

so the Image (range) of  $\sec(\theta) = \frac{1}{\cos(\theta)}$  is  $(-\infty, -1] \cup [1, \infty)$

(all numbers smaller than / equal to -1 OR bigger than / equal to 1)

Restrict domain of  $\sec(x)$  to  $[0, \frac{\pi}{2}) \cup [\pi, \frac{3\pi}{2}]$

1st quadrant

3rd quadrant

Another natural choice is  $[0, \frac{\pi}{2}) \cup (\frac{\pi}{2}, \pi]$ , but our choice makes the derivative of the inverse function nicer

• Domain of  $\sec(x)$  :  $[0, \frac{\pi}{2}) \cup [\pi, \frac{3\pi}{2})$

• Image/range  $\sec(x)$  :  $(-\infty, -1] \cup [1, \infty)$

(all numbers smaller than/equal to -1 OR bigger than/equal to 1)

### Def of arc sec (x)

• Denote the inverse function of this  $\sec(x)$  with domain  $[0, \frac{\pi}{2}) \cup (\frac{\pi}{2}, \pi]$

by  $\text{arc sec}(x)$  or  $\sec^{-1}(x)$

Domain of  $\text{arcsec}(x)$  is  $(-\infty, -1] \cup [1, \infty)$

Image/range of  $\text{arcsec}(x)$  is  $[0, \frac{\pi}{2}) \cup [\pi, \frac{3\pi}{2})$

When  $x$  is in  $(-\infty, -1]$ ,  $\text{arcsec}(x)$  is in  $[\pi, \frac{3\pi}{2})$  } When  $x$  is in  $[1, \infty)$ ,  $\text{arcsec}(x)$  is in  $[0, \frac{\pi}{2})$

# Webwork # 5

$$\int \frac{1}{[9x^2 - 25]^{\frac{3}{2}}} dx$$

①  $x = \frac{5}{3} \sec(\theta)$

$$dx = \frac{5}{3} \sec(\theta) \tan(\theta) d\theta$$

② Write  $\frac{1}{[9x^2 - 25]^{\frac{3}{2}}}$  in terms of  $\theta$ :

$$\frac{5}{\sqrt{9x^2 - 25}} = \frac{1}{\tan \theta}$$

$$\frac{1}{\sqrt{9x^2 - 25}} = \frac{1}{5} \frac{1}{\tan \theta}$$

$$\frac{1}{[9x^2 - 25]^{\frac{3}{2}}} = \frac{1}{5^3} \frac{1}{(\tan \theta)^3}$$

• Let  $\frac{3}{5}x = \sec(\theta)$  where

$\theta$  is in  $[0, \frac{\pi}{2})$  or  $[\pi, \frac{3\pi}{2})$

restricted domain

(from prev page)

so that  $\text{arcsec}(\frac{3}{5}x) = \theta$

makes sense

•  $\frac{d}{d\theta} \sec(\theta) = \sec(\theta) \tan(\theta)$

$$\int \frac{1}{[9x^2 - 25]^{\frac{3}{2}}} dx = \int \frac{1}{5^3 (\tan\theta)^3} \frac{5}{3} \sec(\theta) \tan(\theta) d\theta$$

Let  $\frac{3}{5}x = \sec(\theta)$  where

$\theta$  is in  $[0, \frac{\pi}{2})$  or  $[\pi, \frac{3\pi}{2})$

①  $dx = \frac{5}{3} \sec(\theta) \tan(\theta) d\theta$

②  $\frac{1}{[9x^2 - 25]^{\frac{3}{2}}} = \frac{1}{5^3 (\tan\theta)^3}$

$$= \frac{1}{5^2 \cdot 3} \int \frac{1}{(\tan\theta)^2} \frac{1}{\cos\theta} d\theta$$

$$= \frac{1}{75} \int \frac{\cos\theta}{(\sin\theta)^2} d\theta$$

$$= \frac{1}{75} \int \frac{1}{u^2} du$$

$$u = \sin\theta$$

$$du = \cos\theta d\theta$$

$$= \frac{1}{75} \left(-\frac{1}{u}\right) + C$$

$$= \frac{1}{75} \left(-\frac{1}{\sin\theta}\right) + C$$

$$= \frac{1}{75} \left(-\frac{3x}{\sqrt{9x^2 - 25}}\right) + C$$

# Summary so far

## Webwork #4

$$\int \frac{1}{[x^2 + 2x + 2]^2} dx = \int \frac{1}{[(x+1)^2 + 1]^2} dx$$

Step 1 Complete the square

Turn  $(x^2 + 2x + 2)$  into  $(x+a)^2 + b^2$

$$\begin{aligned} (x^2 + 2x) + 2 &= \left(x^2 + 2x + \left(\frac{2}{2}\right)^2\right) + 2 - \left(\frac{2}{2}\right)^2 \\ &= (x+1)^2 + 1 \end{aligned}$$

$$\int \frac{1}{[x^2 + 2x + 2]^2} dx = \int \frac{1}{[(x+1)^2 + 1]^2} dx$$

If I want two sides to be labeled  $(x+1)$  and  $\sqrt{(x+1)^2 + 1}$   
what should be the label for the hypotenuse?

option (a):

option (b):

option (c):

option (d):

$$\int \frac{1}{[x^2 + 2x + 2]^2} dx = \int \frac{1}{[(x+1)^2 + 1]^2} dx$$

Either

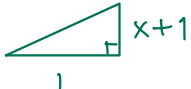

or

will work

but  $\frac{d}{d\theta} \tan(\theta) = [\sec(\theta)]^2$  is easier to work with than  $\frac{d}{d\theta} \cot(\theta) = -\csc(\theta)$

so I choose 

$$\int \frac{1}{[x^2 + 2x + 2]^2} dx = \int \frac{1}{[(x+1)^2 + 1]^2} dx$$

$$\text{Let } \frac{x+1}{1} = \tan(\theta)$$

where  $\theta$  is in  $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$

Restricting the domain of  $\tan(\theta)$  so that  $\arctan\left(\frac{x+1}{1}\right) = \theta$  makes sense

①  $x = -1 + \tan(\theta)$

$$dx = [\sec(\theta)]^2 d\theta$$

② Write  $\frac{1}{[(x+1)^2 + 1]^2}$  in terms of  $\theta$ :

$$\frac{1}{\sqrt{(x+1)^2 + 1}} = \cos(\theta)$$

$$\frac{1}{[(x+1)^2 + 1]^2} = [\cos(\theta)]^4$$

$$\int \frac{1}{[x^2 + 2x + 2]^2} dx = \int \frac{1}{[(x+1)^2 + 1]^2} dx = \int [\cos(\theta)]^4 [\sec(\theta)]^2 d\theta$$

Let  $\frac{x+1}{1} = \tan(\theta)$

where  $\theta$  is in  $(-\frac{\pi}{2}, \frac{\pi}{2})$

$$= \int [\cos(\theta)]^2 d\theta$$

$$= \int \frac{1}{2} (1 + \cos(2\theta)) d\theta$$

$$= \frac{1}{2} \left[ \theta + \frac{\sin(2\theta)}{2} \right] + C$$

$\sin(t) \cos(t) = \frac{1}{2} \sin(2t)$

$$\downarrow = \frac{1}{2} \left[ \theta + \underbrace{\sin(\theta)}_{\substack{\text{opp} \\ \text{hyp}}} \underbrace{\cos(\theta)}_{\substack{\text{adj} \\ \text{hyp}}} \right] + C$$

$\arctan\left(\frac{x+1}{1}\right)$

$$= \frac{1}{2} \left[ \arctan(x+1) + \frac{x+1}{(x+1)^2 + 1} \right] + C$$

①  $dx = [\sec(\theta)]^2 d\theta$

②  $\frac{1}{[(x+1)^2 + 1]^2} = [\cos(\theta)]^4$

# Summary of Sec 7.3 Trig Substitution
