

Sec 2.3 Partitions of sets & the Law of Addition

Partitions

Next HW due Tues

Next quiz (Thurs): 1.5, 2.1, 2.2

Def A (set) partition of a set A is a set of one or more nonempty subsets of A :

$$A_1, A_2, A_3, \dots$$

such that every element of A is in exactly one set.

in symbol: $\downarrow$ (a) $A_1 \cup A_2 \cup A_3 \dots = A$

(b) If $i \neq j$ then $A_i \cap A_j = \emptyset$ ("pairwise disjoint")

Ex Let $A = \{\text{Students in this class}\}$

• Then $\left\{ \left\{ \begin{smallmatrix} \text{1st-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{2nd-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{3rd-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{4th year} \\ \text{students} \end{smallmatrix} \right\} \right\}$

is a partition of A

• $\left\{ \left\{ \begin{smallmatrix} \text{all students} \\ \text{in this class} \end{smallmatrix} \right\} \right\} = \{A\}$

is a partition of A

• $\left\{ \left\{ \begin{smallmatrix} \text{students who} \\ \text{came to class today} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{students who} \\ \text{are absent} \end{smallmatrix} \right\} \right\}$

• But $\left\{ \left\{ \begin{smallmatrix} \text{1st-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{2nd-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{3rd-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{4th year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{grad} \\ \text{students} \end{smallmatrix} \right\} \right\}$

is not a partition of A

because there are no grad students in the class.

• $\left\{ \left\{ \begin{smallmatrix} \text{2nd-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{3rd-year} \\ \text{students} \end{smallmatrix} \right\}, \left\{ \begin{smallmatrix} \text{4th year} \\ \text{students} \end{smallmatrix} \right\} \right\}$

is not a partition of A

because there are 1st year students in the class.

Ex Let $A = \{1, 2, 3, 4\}$. Partitions of A or not?
 $\{\{1, 3\}, \{2, 4\}\}$ yes

$\{\{1, 2, 3\}, \{2, 3, 4\}\}$ no because the sets are not disjoint

$\{\{1, 2\}, \{3\}, \{4\}\}$ yes

$\{\{1, 2\}, \{3\}, \{4\}, \emptyset\}$ No because one of the sets is empty

$\{\{1, 3\}, \{2\}\}$ No because the union of the sets is not A

$\{\{1, 3\}, \{2, 4, 5\}\}$ No because the union of the sets is not A

$\{\{1\}, \{2\}, \{3\}, \{4\}\}$ Yes

$\{\{1, 2, 3, 4\}\}$ Yes

$\{1, 2, 3, 4\}$ No, this is a collection of numbers, not a collection of subsets of $\{1, 2, 3, 4\}$.

Ex Consider the set $\mathbb{Z} = \{\text{integers}\}$.

Some examples of partitions of $\mathbb{Z}$:

$$\{\{n\} \mid n \in \mathbb{Z}\} = \{\dots, \{-1\}, \{0\}, \{1\}, \{2\}, \dots\}$$

$$\{\underbrace{\{n \in \mathbb{Z} \mid n < 0\}}_{\text{set of negative integers}}, \{0\}, \underbrace{\{n \in \mathbb{Z} \mid n > 0\}}_{\mathbb{P}}\}$$

Addition Law

Thm (Law of addition)

If A is a finite set and if $\{A_1, A_2, \dots, A_n\}$ is a partition of A , then

$$|A| = |A_1| + |A_2| + \dots + |A_n|$$

i.e. If A is a finite set and if $A_1 \cup A_2 \cup \dots \cup A_n = A$ and $\underbrace{A_i \cap A_j = \emptyset \text{ whenever } i \neq j}_{\text{"pairwise disjoint"}}, \text{ then}$

$$|A| = |A_1 \cup A_2 \dots \cup A_n| = |A_1| + |A_2| + \dots + |A_n|.$$

Ex $\left\{ \overbrace{\left\{ \begin{array}{l} \text{Students who came} \\ \text{to class this Tue} \end{array} \right\}}^{A_1}, \overbrace{\left\{ \begin{array}{l} \text{Students who were} \\ \text{absent this Tue} \end{array} \right\}}^{A_2} \right\}$

is a partition of $A := \{\text{all students in this class}\}$

$$34 = |A| = |A_1| + |A_2| = 29 + 5$$

Warning | cannot add students by majors because some students have multiple majors

Ex A survey 100 people (who owned phones) found that 60 people owned an iPhone, 50 people owned Android, and 0 people owned other phones.

How many people had both phones?

Ans Let $A_1 = \{\text{surveyed people who owned iPhone}\}$
 $A_2 = \{\text{--- " --- " --- Android}\}$
 $A = \{\text{all people surveyed}\} = A_1 \cup A_2$

$$|A| = |A_1| + |A_2| - |A_1 \cap A_2|$$

to account for
the double counting

$$100 = 60 + 50 - |A_1 \cap A_2|$$

So $|A_1 \cap A_2| = 10$ is the number of people who had both phones.

Thm (Laws of inclusion-exclusion for two sets)

Given finite sets A_1 and A_2 ,

$$|A_1 \cup A_2| = |A_1| + |A_2| - |A_1 \cap A_2|$$

—end—
