Lecture 15b

Eigenbases (finding eigenbases)

Recall: Definition (Eigenbases)

An **eigenbasis** for an $n \times n$ -matrix A is a basis for \mathbb{R}^n consisting of eigenvectors of A.

Recall (Exercise 1 from the last lecture)

The following vectors form an eigenbasis for A.

$$\left\{ \begin{bmatrix} 1\\0\\-2\\1 \end{bmatrix}, \begin{bmatrix} 2\\-1\\1 \end{bmatrix} \right\} \qquad A := \begin{bmatrix} 2 & 2 & 4\\0 & 1 & -2\\0 & 1 & 4 \end{bmatrix}$$

Observation 1 (Matrix multiplication and eigenbases)

Let $v_1, v_2, ..., v_n$ be an eigenbasis for A, and let λ_i denote the eigenvalue of v_i . If $w = c_1v_1 + c_2v_2 + \cdots + c_nv_n$, then

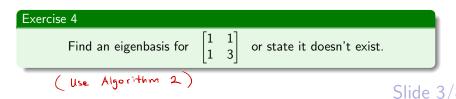

Slide 2/8

Algorithm 2 (How to find an eigenbasis)

We are given an $n \times n$ matrix A.

- Find the eigenvalues of A (by factoring the characteristic polynomial.)
- \bigcirc For each eigenvalue, find a basis of the λ -eigenspace.
 - That is, a basis for $ker(A \lambda Id)$
- 3 Put all the vectors together into a set.
 - If there are n-many vectors, the set is an eigenbasis!
 - If there are fewer than n-many vectors, no eigenbasis exists!

Fact: This algorithm constructs a linearly independent set.

Solution to Exercise 4 (
$$poge 1/3$$
) using Algorithm 2
Set $A := \begin{bmatrix} 1 & 1 \\ 1 & 3 \end{bmatrix}$.

Step 1) Find the eigenvalues of A by factoring the characteristic polynomial.

• Find the characteristic polynomial of A:

$$P_{A}(x) = \det (x|d - A)$$

$$= \det (\begin{bmatrix} x-1 & -1 \\ -1 & x-3 \end{bmatrix})$$

$$= (x-1)(x-3) - 1$$

$$= x^{2} - 4x + 3 - 1$$
So $P_{A}(x) = x^{2} - 4x + 2$
• Find roots of $P_{A}(x)$ (quadratic formula or "complete the square")

The roots are
$$4 \pm \sqrt{16-8} = \frac{4 \pm \sqrt{8}}{2} = \frac{4 \pm 2\sqrt{2}}{2} = 2 \pm \sqrt{2}$$

So the eigenvalues of A are
$$\lambda_1 = 2 + \sqrt{2}$$
 and $\lambda_2 = 2 - \sqrt{2}$

Solution to Exercise 4 (page 2/3)

Step (2)(): Find a basis for the
$$\lambda_{1}$$
 eigenspace of $A(\lambda_{1} = 2 + \sqrt{2})$,
that is, find a basis for ker $(A - (2+\sqrt{2})|d)$.
 $A - (2+\sqrt{2})|d = \begin{bmatrix} 1 & 1 \\ 1 & 3 \end{bmatrix} - \begin{bmatrix} 2+\sqrt{2} & 0 \\ 0 & 2+\sqrt{2} \end{bmatrix} = \begin{bmatrix} 1-2-\sqrt{2} & 1 \\ 1 & 3-2-\sqrt{2} \end{bmatrix} = \begin{bmatrix} -1-\sqrt{2} & 1 \\ 1 & 1-\sqrt{2} \end{bmatrix}$
Solve for $(A - (2+\sqrt{2})|d) \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$:
 $\begin{bmatrix} -1-\sqrt{2} & 1 \\ 1 & 1-\sqrt{2} \end{bmatrix} \begin{bmatrix} 0 \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 0 \\ 0 & 1+\sqrt{2} \end{bmatrix} \begin{bmatrix} 0 \\ 0 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & 1-\sqrt{2} \\ 0 \end{bmatrix} = \begin{bmatrix} 1 &$

Solution to Exercise 4 (page 3/3)

Step (2): Find a basis for the
$$N_2 \cdot cigenspace of A \left(\lambda_2 = 2 - l\bar{\lambda} \right)$$
,
that is, find a basis for $\ker \left(A - (2 - l\bar{\lambda}) Id \right)$.
 $A - (2 - l\bar{\lambda}) (d = \begin{bmatrix} l & l \\ l & 3 \end{bmatrix} - \begin{bmatrix} 2 - l\bar{\lambda} & 0 \\ 0 & 2 - l\bar{\lambda} \end{bmatrix} = \begin{bmatrix} l - 2 + l\bar{\lambda} & l \\ l & 3 - 2 + l\bar{\lambda} \end{bmatrix} = \begin{bmatrix} -1 + l\bar{\lambda} & l \\ 1 & 1 + l\bar{\lambda} \end{bmatrix}$
Solve for $\left(A - (2 - l\bar{\lambda}) Id \right) \left[\frac{l}{2} \right] = \begin{bmatrix} l & l + l\bar{\lambda} \\ 0 \end{bmatrix} = \begin{bmatrix} l & l + l\bar{\lambda} \\ 0 \end{bmatrix} = \begin{bmatrix} -1 + l\bar{\lambda} & l \\ 1 & l + l\bar{\lambda} \end{bmatrix} \begin{bmatrix} 0 \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 1 & l + l\bar{\lambda} \end{bmatrix} \begin{bmatrix} 0 \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 1 & l + l\bar{\lambda} \end{bmatrix} \begin{bmatrix} 0 \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 0 \end{bmatrix} = \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 1 \end{bmatrix} \end{bmatrix}$
Since the 2nd column has no leading 1, let $y = t \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 1 \end{bmatrix} \end{bmatrix}$
Since the 2nd column has no leading 1, let $y = t \begin{bmatrix} 1 & l + l\bar{\lambda} \\ 1 \end{bmatrix} \end{bmatrix}$
A basis for the λ_1 eigenspace of A is $\begin{bmatrix} 1 & l + l\bar{\lambda} \\ 1 \end{bmatrix}$

Find an eigenbasis for

$$\begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix}$$

or state it doesn't exist.

Use Algorithm 2 (How to find an eigenbasis)

Slide 4/8

Find an eigenbasis for

$$\mathbf{A} := \begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix}$$

or state it doesn't exist.

Step (): • Find characteristic polynomial and compute roots
(Find
$$P_A(x) = det (x|d-A) = det (\begin{bmatrix} x-1 & 1 \\ -1 & x+1 \end{bmatrix}) = (x-1)(x+1) t 1 = x^2 - 1 + 1 = x^2$$

eigenvalues $P_A(x) = x^2$
of A) The only root of $P_A(x) = x^2$ is O.
The only eigenvalue of A is O.
Step (2): • Find a basis for the O-eigenspace of A,
(Find a basis that is, find a basis for ker $(A - 01d) = ker (A)$
for each Find colutions to $A[x_1] = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$ cqual to A
eigenspace of A)
 $\begin{bmatrix} 1 - 1 & 0 \\ 1 & -1 \end{bmatrix} = \begin{bmatrix} 1 - 1 & 0 \\ 0 & 0 \end{bmatrix} = x - y = 0 \Rightarrow x - t = 0 \Rightarrow \begin{bmatrix} x = t \\ x = t \end{bmatrix}$
A basis for the D-eigenspace of A is $\begin{bmatrix} 1 \\ 1 \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \end{bmatrix}$
Slep (3): Since $\begin{bmatrix} 1 \\ 1 \end{bmatrix}$ has fewer than $n=2$ vectors, no eigenbasis exists. Slide 4/8

Fact 3 (When are there enough eigenvectors to have an eigenbasis?)

A matrix A has an eigenbasis if and only if
width(A) =
$$\sum_{\text{eigenvalues } \lambda} \dim(E_{\lambda}(A))$$

Reasoning: A basis for $E_{\lambda}(A)$ (the λ -eigenspace of A) has $\dim(E_{\lambda}(A))$ -many vectors.

For example, if A is 4×4 with eigenvalues λ_1, λ_2 and the dimension of the λ_1 -eigenspace of A is 1 and the dimension of the λ_2 -eigenspace of A is 1, then width(A) \neq 1+1 so A has no eigenbasis.

Exercise 6

Let
$$\begin{bmatrix} 2 & 2 & 1 \\ 2 & 5 & 2 \\ 1 & 2 & 2 \end{bmatrix}$$
.

Show that A has an eigenbasis (without finding an eigenbasis). Note: A has two eigenvalues, 1 and 7.

Hint: Compute just dim (E1(A)) and dim (E7(A)) then use Fact 3 Slide 5/8

 $\begin{array}{c} \textbf{A:=} 2 & 2 & 1 \\ \text{Let} & 2 & 5 & 2 \\ 1 & 2 & 2 \end{array} \right] .$

Show that A has an eigenbasis (without finding an eigenbasis). Note: A has two eigenvalues, 1 and 7.

Find basis/dimension of
$$E_1(A) = \ker(A-1Id)$$

faster
(well compute shorthand for the
Just the I-eigenspace of A
dimension)
 $A - 1Id = \begin{bmatrix} 2-1 & 2 & 1 \\ 2 & 5-1 & 2 \\ 1 & 2 & 2-1 \end{bmatrix} = \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}$
Since all columns are multiple of each other,
rank $(A-1Id) = 1$.
Recall "Rank-Nullity Theorem":
width (M) = rank(M) + dim(ker(M))]
So dim(ker(A-1Id)) = 3 - rank(A-1Id)
= 3 - 1
E = 9

... Dimension of E1 (A) is 2.

Find basis/dimension of E7(A) faster to the 7-eigenspace of A Since 7 is an eigenvalue of A, a 7-eigenvector exists. So the 7-cigenspace contains a non-zero vector. Recall: The only subspace with dimension 0 is the zero subspace. All other subspaces have dimension 1 or higher. \Rightarrow So dim $(E_7(A)) \ge 1$. $\sum_{\substack{\text{eigenvalues}\\\lambda}} \dim (E_{\lambda}(A)) = \dim (E_{1}(A)) + \dim (E_{7}(A))$ By Fact 3, ... A has an eigenbasis.

A useful trick

If λ is an eigenvalue of A, then

- there is at least one λ -eigenvector, so
- the λ -eigenspace has dimension at least 1, so
- a basis for the λ -eigenspace has at least 1 vector.

Hence, each distinct root of the characteristic polynomial guarantees at least one vector in our potential eigenbasis.

Theorem 4 (*n*-many distinct eigenvalues)

If an $n \times n$ -matrix has *n*-many distinct eigenvalues, it must have an eigenbasis.

Note: If an $n \times n$ -matrix has fewer than n distinct eigenvalues, it may have an eigenbasis (We need to use Algorithm 2 or another method to find out for sure).

Slide 6/8

Determine whether the following matrix has an eigenbasis.

$$\begin{bmatrix} 1 & 2 & 3 \\ 0 & 0 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

Slide 7/8

Determine whether the following matrix has an eigenbasis.

$$A := \begin{bmatrix} 1 & 2 & 3 \\ 0 & 0 & 0 \\ 1 & 1 & 1 \end{bmatrix}$$

$$P_{A}(x) = det \left(\begin{array}{c} x \mid d - A \end{array} \right)$$
$$= det \left(\begin{array}{c} x \mid z \quad 3 \\ 0 \quad x \quad 0 \\ 1 \quad | \quad x - 1 \end{array} \right)$$
$$= 2^{2} \frac{2}{2} \cdot \frac{1}{2} \left(\begin{bmatrix} x - 1 \quad 3 \end{array} \right)$$

$$= \times (-1) \quad \det \left(\begin{bmatrix} 1 & x - 1 \end{bmatrix} \right)$$
$$= \times \left[(x - 1)(x - 1) - 3 \right]$$
$$= \times \left[x^{2} - 2x + 1 - 3 \right]$$
$$P_{A}(x) = x^{3} - 2x^{2} - 2x$$

• compute roots

$$\beta_{A}(x) = \frac{x}{x^{2}-2x-2}$$

 $\lambda_{i=0}$
One of the roots is $\lambda_{1}=0$
The other two roots ...
 $\frac{2\pm\sqrt{4+8}}{2} = \frac{2\pm\sqrt{12}}{2} = \frac{2\pm2\sqrt{3}}{2} = 1\pm\sqrt{3}$
 $\lambda_{2} = 1\pm\sqrt{3}$ and $\lambda_{3} = 1-\sqrt{3}$
 \vdots By Theorem 4, since A is 3x3 and
has 3 distinct eigenvalues,
A must have an eigenbasis,

Slide 7/8

Theorem (A bound from the characteristic polynomial)

Let λ be an eigenvalue of A. Then

 $1 \leq \dim(E_{\lambda}(A)) \leq (\# \text{ of times } (x - \lambda) \text{ appears in } \rho_A(x))$

That is, if λ is a root of the characteristic polynomial $\rho_A(x)$ with multiplicity *m*, then the dimension of the eigenspace is between 1 and *m*.

Two notions of multiplicity for eigenvalues

There are two different 'ways to count' an eigenvalue.

- dim($E_{\lambda}(A)$) is the **geometric multiplicity** of the eigenvalue λ .
- (# of times (x λ) appears in ρ_A(x)) is the algebraic multiplicity of the eigenvalue λ.

Slide 8/8
